

# Same-coordinate Boozer-file round-trip audit

(a) file round-trip geometry

(b) coefficient round trip

(c) signed transport values

(d) audit classification  
same VMEC state, Boozer transform,  
half-grid surfaces, and flux scale

max geometry rdif:  $4.421 \times 10^{-8}$

max coefficient rdif:  $2.275 \times 10^{-9}$

closed: True

The tested radial coordinate is the VMEC half grid used by Boozer spectra, not the full-grid toroidal-flux profile  $\phi_b$ .
