

Direct Boozer-file backend validation audit

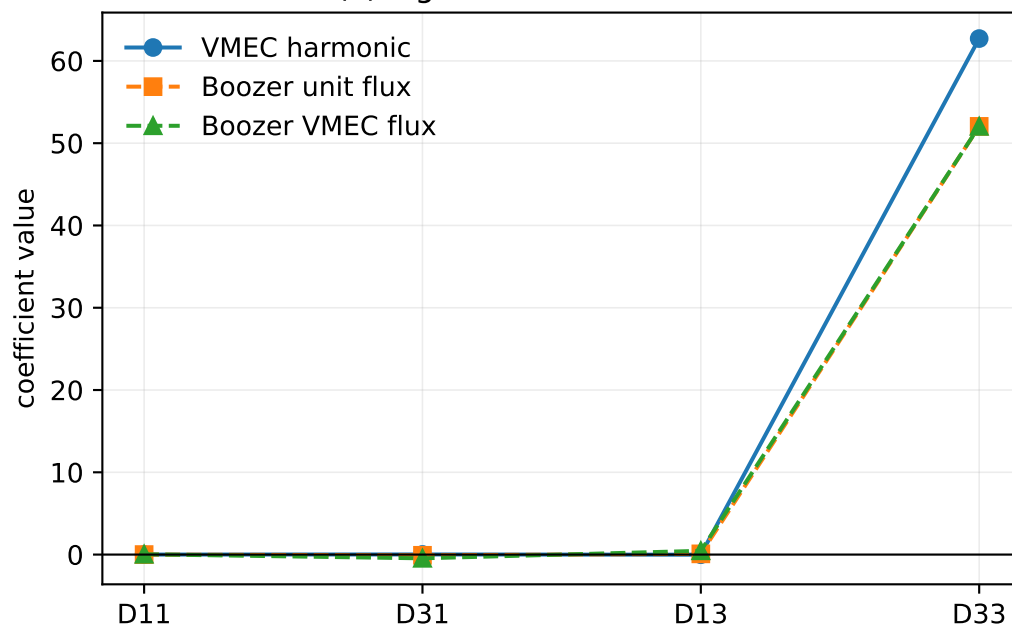

(a) geometry and source channels

(b) transport coefficients

(c) signed coefficient values

(d) audit classification

best direct path: direct_boozer_vmec_edge_flux
max coefficient rdif: 1.036e+00
radial-drift rdif: 1.285e+00
closed: False

A failure localizes the issue to geometry/source convention before any reduced-closure or current-profile comparison.
